SYNTHESIS

Cementless Stem

SYNTHESIS is a femoral stem combining a well proven anchoring concept (three-dimensional conical design and rectangular cross-section) with a range of stems designed to allow the best reproducibility of joint geometry thanks to different offsets.

Taper

12/14 (top angle 5°42'30") BIOLOX approved

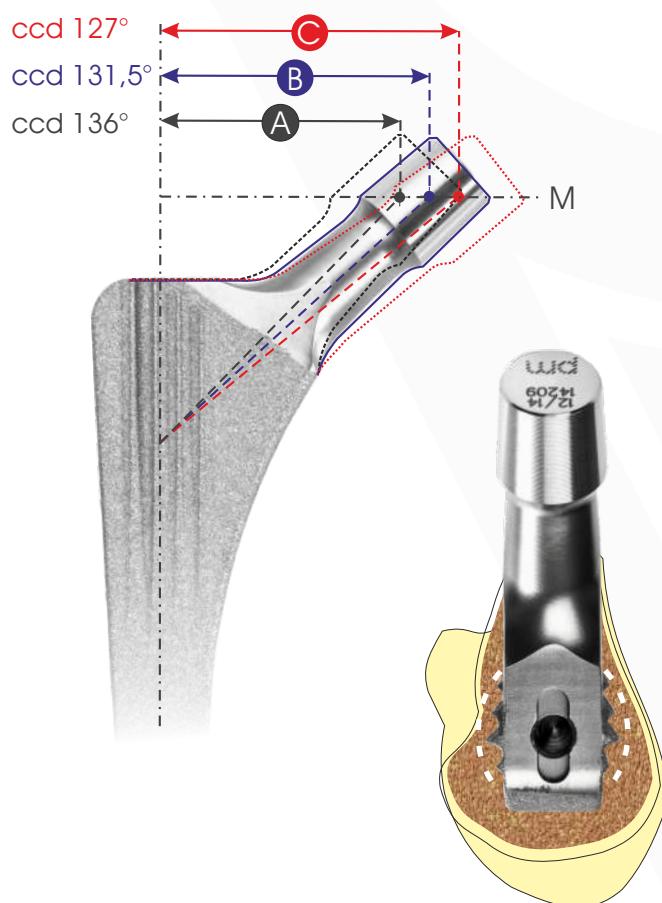

Titanium sandblasted surface

The optimized roughness of the microstructured surface and the well proven biocompatibility features of TiAlNb alloy promote osseointegration.

Reduced neck cross-section and short taper for optimized range of motion (ROM).

Three-dimensional conical design and rectangular cross-section guarantees optimal stability of the implant.

The wide metaphyseal section allows fitting on the calcar region; the longitudinal ribs penetrate the cancellous bone increasing primary stability.

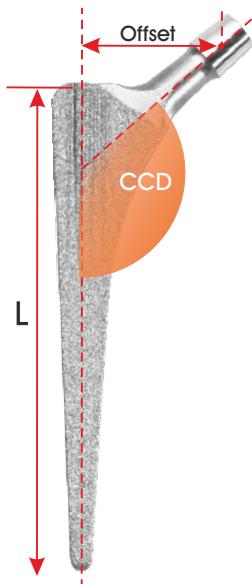

13 Implant sizes

3 Off-sets

3 offsets available for each stem size, with 5mm increments without affecting the leg length.

The ribs in the proximal region of the stem have a flat base design tapering proximally, thus allowing penetration into the cancellous bone of the metaphyseal region.

The elliptical geometry was designed to allow optimal fitting to the proximal femur cross-section.

SYNTHESIS - Cementless Femoral Stem

Size	L mm	Offset A CCD 136°		Offset B CCD 131,5°		Offset C CCD 127°	
		Offset mm	Reference	Offset mm	Reference	Offset mm	Reference

Information**INTENDED PURPOSE:**

SYNTHESIS is a femoral stem intended for use in total or partial Hip Replacement procedures, combined with a femoral ball head (or a bi-articular head) and an acetabular cup. Indicated for primary hip arthroplasties in cases of serious joint degeneration, mainly due to arthrosis and post-traumatic degenerative factors, where cortical bone structure is suitable to guarantee a correct and enduring mechanical fixation by means of press-fit technique. Device fixation is obtained by means of primary cementless press-fit stabilization and long term biological integration.

MATERIALS:

Titanium Aluminium Niobium forged alloy (Ti6Al7Nb) ISO5832/11

SURFACE FINISHING:

microstructured sandblasted surface ($ra \pm 4\text{-}6\mu\text{m}$)

STERILIZATION:

Method: Irradiation (Beta or Gamma rays - nominal dose 25 kGy) or vaporized Hydrogen Peroxide (VH2O2).

Validity: 5 years (Beta) - 10 years (Gamma-VH2O2).

CLASSIFICATION:

Class III as reported in Directive 2005/50/CE (and related D.lgs 26 april 2007 n.65) concerning re-classification of Hip, Knee and Shoulder joint prostheses which modifies classification criteria of Annex IX of Directive 93/42/CEE and next integrations and amendements.
